Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Anti-factor IX/IXa antibody H chain V domain CDR1 amino acid sequence

Complementarity determining region 1; CDR1; antibody; Gla domain; factor IX/IXa; blood coagulation; deep venous thrombosis; arterial thrombosis; unstable angina; post myocardial infarction; coronary artery bypass graft; CABG; stroke; tumour growth; metastesis; percutaneous transluminal coronary angioplasty; PTCA; inflammation; septic shock; hypotension; adult respiratory distress syndrome; ARDS; arterial fibrillation; disseminated intravascular coagulopathy; DIC.

Kirchhofer D; Hass PE, Judice JK,

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction.

This sequence represents a complementarity determining region 1 (CDR1) of the heavy chain variable domain of a human anti-factor IX/Ixa Gla domain antibody. Pactor IXA/Ixa a vitamin K dependent plasma serine procease that participates in the blood coaqulation pathways. The Gla domain of factor IXa and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial

```
Aspergillus oryzae KBN616 and Aspergillus sojae BA-104 respectively which have molecular weights of approximately 73 kD (as determined by gel filtration). The enzymes have an optimum temperature of approximately 50 degrees Celsius, and an optimum pH of about 8.5. The glutaminases catalyse the conversion of L-glutamine to L-glutamic acid, and may be used in the production of fermented foodstuffs such as soy sauce and miso. Sequences AABA1787-1814789 represent fragments of Aspergillus oryzae KBN616 glutaminase which were used as the basis for the design of Aegenerate PCR primers AAA72206, AAA72207 and AAA72209. These primers were used in the isolation of genomic DNA encoding Aspergillus oryzae
                                                                                                                                                                                                                                                                 ö
           the treatment or prophylaxis of thrombotic or coaguiopathic diseases or disorders in a mammal for which inhibiting a FIX/IXa mediated event is indicated, e.g. deep venous thrombosis, arterial thrombosis, unstable angina, post myocardial infarttion, post surgical thrombosis, coronary artery bypass graft (CABG), percutaneous transluminal coronary angioplasty (PTCA), stroke, tumour growth, invasion or metastasis, inflammation, septic shock, hypotension, adult respiratory distress syndrome (ARDS), arterial fibrillation and disseminated intravascular coagulopathy (DIC)
platelets. Compositions comprising the antibodies are used for

The enzymes have an optimum temperature of approximately 50 degrees Celsius, and an optimum pH of about 8.5. The glutaminases catalyse the conversion of L-glutamine to L-glutamic acid, and may be used in the production of fermented foodsruffs such as soy sauce and miso. Sequences AAB14784-B14786 represent the N-terminal sequences determined for three V8 protease fragments (P1-P3) of Aspergillus oryzae KBN616 glutaminase in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to two novel glutaminases (AAB14781, AAB14782)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gape

                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                       The invention relates to producing gene libraries, comprising immunoglobulin light and heavy variable region. The method involves selecting light chain that binds with the heavy chain product to produce a functional conformation, producing a gene library comprising a collection of these light chain variable genes, and combining with gene library of heavy chain variable genes. The method is used for production of gene and antibody libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; HCV; hepatitis C virus; El antigen; monoclonal antibody; vaccine; hepatotropic; Fab; hypervariable region; E2 antigen; antibody.
                                                                                                                                                                                  Producing gene libraries and antibody libraries, involves selecting a
light chain that binds to a heavy chain product to produce a functional
formation, and producing a gene library of the light chain variable

The vaccine composition comprising the antibodies or antigen binding fragments against HCV B1 or E2 antigen or its hypervariable region is useful in treating or preventing HCV infection in a subject. Sequences ABC76513-ABG76568 represent human monoclonal antibodies against HCV B1 antigen
Vaccine comprising a human monoclonal antibody against hepatitis C virus (HCV) El or E2 antigen, useful for treating or preventing HCV infection.
                                                                                                                                                                                  The invention relates to a human monoclonal antibody or its antigen binding fragments, which exhibit immunological binding affinity for a hepatitis C virus (HCV) B1 antigen, comprising an amino acid sequence homologous to the binding portion of a human antibody Fab molecule from combinatorial antibody library. The vaccine composition comprising the antibodies or antigen binding fragments against HCV B1 or E2 antigen or its hypervariable region is useful in treating or preventing HCV infection in a subject. Sequences ABG76513-ABG76568 represent human monoclonal antibodies against HCV E1 antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, HCV; hepatitis C virus, El antigen; monoclonal antibody, vaccine;
hepatotropic; Fab; hypervariable region; E2 antigen; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vaccine comprising a human monoclonal antibody against hepatitis C virus (HCV) \rm El or \rm E2 antigen, useful for treating or preventing HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a producter operably linked to the nucleic acid
cenceding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
polypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
contisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
contiferation or the activity of a gene in an operon required for
proliferation or the activity of a gene in an operon required for
contisense product or that has an activity against a biological pathway
required for proliferation, or that inhibits proliferation; (8)
contisense nuclei; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (11) a culture comprising strains in which the gene
compound's activity; (11) a culture comprising strains in which the gene
compound's activity; (11) a culture comprising strains in which the gene
compound activity; (11) a culture comprising strains in which the gene
compound of an organism. The antisense nucleic acids are useful for
contisting proteins or screening for homologous nucleic acids required
for cellular proliferation to isolate candidate molecules for rational
drug discovery programs, or for screening homologous nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antiBense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                     Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zyskind JW;

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and polynucleotides encoding them. The sequences are useful in diagnosis and polynucleotides encoding them. The sequences are useful in diagnosis and prophylaxis and treatment of pathological conditions resulting from a prophylaxis and treatment of pathological conditions resulting from a compound, such as a polypeptide, or fetcive antibacterial targets, as targets for antibacterial durgs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa drugs, as templates for recombinant components for diagnosis and/or treatment of P. aeruginosa caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed produced part of the printed patent patent of the printed patent patent patent forms the patent forms forms the patent forms the patent forms forms the patent forms forms the patent forms forms the patent forms forms

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1, SEQ ID NO 9985; 122pp; English.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant the case of soybean. The method of producing a plant with the recombinant DNA construct and growing the transforming a plant with the compinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with the improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, nitrogen or content, improved yield by modification of photosynthesis or by phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lightin production or improved galactomannan RESULT 9

New polynucleotides which encode polypeptides involved in olfactory sensation for identifying olfactory agonists and antagonists.

Example 6; Page 1455-1456; 1857pp; English.

The present sequence is a polypeptide encoded by one of 144 newly mined human genes. It was used as a query sequence in a database search of olfactory receptor (OR)-like sequences. The invention relates to isolated polynucleotides encoding polypeptides involved in olfactory sensation. The polynucleotides can be used in screening for olfactory agonists and artagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different

The polynucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining the interaction pattern of a composition with the receptors, and can be used for determining the interaction of the interaction of the interaction pattern of a composition with the receptors, and can be used for determining the interaction of th

This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to molecules and the encoded proteins thereof. Specifically, it refers to constant a constant and signal method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodies, antisense molecules and siRNAs that can all be used to bind to antibodies, antisense molecules and siRNAs that can all be used to bind to antibodies are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzhaimer's disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintaining equilibrium of sense or morbor function, and for treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, nootropic, antiparkinsonian, cytostatic and tranquiliser activities. This polypeptide is a protein encoded by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but sequence is not proper by the property of the specification but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                     New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.

This invention describes a novel glutaminase enzyme isolated from Aspergillus oryzae which catalyses the decomposition of glutamine to glutamic acid and ammonia. The purified glutaminase and determined partial amino-acid sequence can be used for enhancing taste particularly and pattes as well as other seasoning materials. The gene thus obtained can be applied as probe for hybridization providing the gene-containing DNA fragments from genome and cDNA libraries of A. oryzae and A. nidulans, and subsequently modified glutaminase-producing breed. The secreting ability. This sequence represents the A. oryzae glutaminase enzyme described in the method of the invention

A. oryzae glutaminase protein #1.

This invention describes a novel glutaminase enzyme isolated from Aspergillus oryzae which catalyses the decomposition of glutamine to glutamic acid and ammonia. The purified glutamines and determined partial amino-acid sequence can be used for enhancing taste particularly in glutamic acid-converting food processing to give e.g. seasoning sauces and pastes as well as other seasoning materials. The gene thus obtained can be applied as probe for hybridization providing the gene-containing DNA fragments from genome and cDNA libraries of A. oryzae and A. nidulans, and subsequently modified glutaminase-producing breed. The novel strain of A. oryzae is a highly active because of its somatic secreting ability. This sequence represents the A. oryzae glutaminase enzyme described in the method of the invention Aspergillus oryzae-originated glutaminase and partial amino-acid sequences for enhancing taste particularly in glutamic acid-converting food processing to make e.g. seasoning sauces and pastes. Glutaminase; decomposition; glutamine; glutamic acid; ammonia; taste enhancer; seasoning; sauce; paste. Aspergillus oryzae KBN616 glutaminase. AAB14781 standard; protein; 703 AA. 06-DEC-2000 (first entry) AAB14781;

Glutaminase; Aspergillus oryzae KBN616; glutamic acid synthesis; fermentation; foodstuff production; miso; soy sauce.

Aspergillus oryzae

```
This sequence represents a novel glutaminase from Aspergillus oryzae KBN616. The invention relates to two novel glutaminases (AAB14781, AAB14782) from Aspergillus oryzae KBN616 and Aspergillus sojae BA-104 respectively which have molecular weights of approximately 73 kD (as determined by gel filtration). The enzymes have an optimum temperature of approximately 50 degrees Celsius, and an optimum ph of about 8.5. The glutaminases catalyse the conversion of L-glutamine to L-glutamic acid, and may be used in the production of fermented foodstuffs such as soy

Oylochrome P450 3A6 (version 1) - rabbit
NyAlternate names: cytochrome P450 3c
NyContains: axidoracductase (EC 1.-..)
NyContains: axidoracductase (EC 1.-..)
Cybecies: Oryctolagus cuniculus (domestic rabbit)
Cybate: 31-Dec-1988 #sequence_revision 31-Dec-1988 #text_change 09-Jul-2004
Cybate: 31-Dec-1988 #sequence_revision 31-Dec-1988 #text_change 09-Jul-2004
Cybate: 31-Dec-1988
NyDalet, C: Clair, P.; Daujat, M.; Fort, P.; Blanchard, J.M.; Maurel, P.
DNA 7, 39-46, 1988
A;Title: Complete sequence of cytochrome P450 3c cDNA and presence of two mRNA species way Reference number: A29487; MUID:88166352; PMID:3349903
A;Reference number: A29487
A;Residues: 1-501 cDN AA31430.1; PID:9165574
A;Residues: 1-501 cDN AA31430.1; PID:9165574

RESULT 14

```
Ajdemia CYPPAS, cytochrome P450 CYPPAS, cytochrome P450 homology cytoch

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction.

Claim 2; Fig 2; 84pp; English.

This sequence represents a complementarity determining region 2 (CDR2) of the heavy chain variable domain of a human anti-factor IX/IXa Gla domain antibody. Factor IXA/IXa a vitamin K dependent plasma serine procease that participates in the blood coaplation pathways. The Gla domain of factor IXa and its zymogen factor. IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial

```
Novel human antibody which binds human interleukin (IL)-4 receptor and is capable of inhibiting IL-4 induced biological activity, functions as IL-4 antagonist and is useful for treating septic arthritis, scleroderma.
                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a human antibody (an interleukin (IL)-4 antagonist) (I) that binds human IL-4 receptor (IL-4R), and is capable of
the treatment or prophylaxis of thrombotic or coagulopathic diseases or disorders in a mammal for which inhibiting a FIX/IXa mediated event is disorders in a mammal for which inhibiting a FIX/IXa mediated event is indicated, e.g. deep venous thrombosis, arterial thrombosis, unstable angina, post myocardial infarction, post surgical thrombosis, coronary artery bypass graft (CABG), percutaneous transluminal coronary angioplasty (PTCA), stroke, tumour growth, invasion or metastasis, inflammation, septic shock, hypotension, adult respiratory distress syndrome (ARDS), arterial fibrillation and disseminated intravascular cosgulopathy (DIC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; antibody; interleukin; IL-4; antagoniat; receptor; IL-4 receptor;

inhibiting an IL-4-induced biological activity. (I) is also useful for inhibiting both IL-4-induced biological activity in vivo in a human, and for treating septic arthritis in a human afflicted with septic arthritis. (I) is also used for treating conditions such as septic/reactive arthritis, dermathis herpetiformis, conditions such as septic/reactive arthritis, dermathis herpetiformis, curicaria (sepecially chronic idiopathic uriticaria), ulcers, gastric inflammation, mucosal inflammation, ulcerative colitis, Crohn's disease, inflammation, bwell disease, other disorders of the digestive system in which IL-4 plays a role (e.g. IL-4-induced inflammation of part of the gastrointestinal tract), conditions in which IL-4-induced barrier of disruption plays a role (e.g. conditions characterized by decreased epithelial barrier function in the lung or gastrointestinal tract), scleroderma, hypertrophic scarring, whipple's disease, benign prostate chyperplasia, IL-4-induced pulmonary conditions, allergic reactions to hyperplasia, IL-4-induced pulmonary conditions, allergic reactions to scleroderma, hypertrophic scarring, whipple's disease, benign prostate strauss syndrome, disease, sickle cell disease, benign prostate cucoimmune lymphoproliferative syndrome, autoimmune haemolytic anemia, strauss syndrome, drave's disease, pre-eclampsia, Sjogran's syndrome, caucoimmune lymphoproliferative syndrome, autoimmune blistering companies also find use as adjuvante to allergy immunocherapy and as canagonists also find use as adjuvante to allergy immunocherapy and as canagonists also find be beneficial in treating or preventing the disease.

THI response would be beneficial in treating or preventing the disease.

THI response would be beneficial in treating or preventing the disease.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNP) super family and induces B cell to proliferation and differentiation. The antibodies of the invention have proliferation, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be associated with aberrant expression of BLyS. They may also be and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumacoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and continued in the method of the invention

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell to tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antithemmatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be associated with aberrant sypression of BLyS. They may also be and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune (AlDS). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13q34 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFv8) derived, preferably, from the variable composition to factor of early propertied. The variable composition of either human, murine, rat or monkey BLyS. The fragment thereof, of either human, murine, rat or monkey BLyS. The composition, disquests and prognosis of diseases related to the eaberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders concluding myserbhaia and rheumatoid archritis, infectious diseases such as ALDS and proliferative disorders including leukaemia, carcinoma and concluding such as and multiple sclerosis, inflammatory actions and contintial and proliferative disorders including leukaemia, carcinoma and contintial and proliferative disorders including leukaemia, carcinoma and contintial and proliferative disorders including leukaemia, carcinoma and contintial and such as anticheumatic, antiallergic and cytostatic. This contypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of directely from WIPO at ftp.wipo.int/published pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibody; B lymphocyte stimulator; BLyS; tumour necrosis factor; B cell proliferation; differentiation; scFv, myasthenia gravis; multiple scleroslis; asthma; rheumatorid arthritis; AIDS; leukaemia; carcinoma; lymphoma; antirheumatic; antiathritic; neuroprotective; antinflammatory; antiathmatic; antiallergic; cytostatic.

WPI; 2003-505530/47.

Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.

Example 1; SEQ ID NO 1323; 394pp; English.

This invention relates to novel antibodies that immunospecifically bind CC to B lymphocyte stimulator (BbyS). The BbyS gene has been mapped to chromosome 1344 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single companies (screws) derived, preferably, from the variable companies (screws) derived, preferably, from the variable companies (screws) derived, preferably, from the variable companies of either human, murine, rat or monky BbyS. The companies of either human, murine, rat or monky BbyS. The companies and prognosis of diseases related to the sact and the detection, diagnosis and prognosis of diseases related to the sact and the compositions are useful for identifying immune diseases including myasthenia gravis and multiple sclerosis, inflammatory composited and multiple sclerosis, inflammatory and proliferative diseorders including leukemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various continitiammatory, antiasthmatic, antiathritic, neuroprotective, continitialmanalismuscomy and such as single chain antibody that binds BbyS of the convertion. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format.

Antibodies against B Lymphocyte Stimulating polypeptides, useful for the

```
This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell collision and differentiation. The antibodies of the invention have proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, inheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (cvID) and acquired immunodeficiency syndrome (AIDS)). ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to novel antibodies that immunospecifically bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single chain antibody that immunospecifically binds BLyS SeqID 1114.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antibody; B lymphocyte stimulator; BLyS; tumour necrosis factor; B cell proliferation; differentiation; scFv; myasthenia gravis; multiple sclerosis, asthma; rheumatoid arthitis; AIDS; leukaemia; cardinoma; lymphoma; antirheumatic; antiathritic; neuroprotective; entiinflammatory; antiasthmatic; antiallergic; cytostatic.

cc to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 19434 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvB) derived, preferably, from the variable chary CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The creament invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As uch, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders as ALDS and proliferative disorders including leakeamia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various crivities such as antirheumatic, antiallergic and cytostatic. This antinflammatory, antiallergic and cytostatic. This antinflammatory as a single chain antibody that binds BLyS of the invention. NoTE: The sequence data for this patent did not form part of disorder antiple of properties the printed specification, but was obtained multiple and cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human heterodimeric antibodies or their antibody fragments, useful as anti-toxins or anti-infectives with respect to infective agents, e.g. anthrax, botulinum, smallpox, Venezuelan equine encephalomyelitis or West
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              receptor;

The present invention describes a human heterodimeric antibody (I) (fragment) having a binding affinity of at least 1x10-8 M to the protective antigen of Bacillus anthracis or a molecule involved in anthrax infection that blocks binding of the antigen or molecule to cell receptors, edema factor and lethal factor. (I) has virucide and antibacterial activities, and can be used in immunotherapy. The antibodies (I) are useful as anti-toxins or anti-infectives with respect to infective agents, such as anthrax, botulinum, smallpox, Venezuelan equine encephalomyelitis virus (VEEV), or West Nile virus (WNV). The present sequence represents a human heterodimeric antibody heavy chain of the present invention. Claim 11; SEQ ID NO 97; 67pp; English.

Novel neuromodulatory agent (a human IgM monoclonal antibody), promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system, useful to treat post-infectious encephalomyelitis.

Claim 23; Fig 17; 219pp; English.

The invention provides a neuromodulatory agent (1) capable of promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system (CNS). (I) is capable of inducing remyelination, promoting callular proliferation of glial calls, and promoting Ga2+ signaling with oligodendrocytes. An humanised antibody to (1) can be selected from antibody sHIGMS2 (LYM 22), ebvHigM MBI19D10, ebv HigM cB2bG8, AKGN4, CB21E12, CB2LE7 or MBI19ES. (I) is useful for stimulating remyelination of CNS axons, stimulating proliferation of glial cells in

CC CNS axons, or treating demyelinating disease of CNS in a mammal in need of such therapy. (I) is capable of binding to structures and cells within CC CNS. (I) is preferably useful for treating a demyelinating disease of CNS of a mouse infected with Strain DA of Theiler's murine encephalomyelitis of a mouse infected with Strain DA of Theiler's murine encephalomyelitis (TMEV) or for treating a human being having multiple sclerosis, or a post-or human or domestic animal with a viral demyelinating disease, or a post-or estimulating the proliferation of gilal cells from mixed cell culture. (I) is also useful for stimulating remyelination of CNS axons. The antibodies contains that causes demyelination or toher neurodegenerative condition in subject. Methods where (I) is administered to a patient are useful cor treating multiple aclerosis, Parkinson's disease, Alzheimer's disease, amyortophic lateral sclerosis (ALS), a viral demyelinating chisease, CNS diseases, and other conditions in the CNS where nerves are damaged as by trauma. The present sequence represents the sHigM22 heavy condition viraliable region clone B amino acid sequence

Immunopolypeptide for diagnosis and treatment of human autoimmune disease, e.g., human rheumatoid arthritis, comprises a polypeptide that binds to human glucose-6-phosphate isomerase.

Claim 3; Fig 4A; 47pp; English.

The invention describes an immunopolypeptide comprising a polypeptide that binds to human glucose-6-phosphate isomerase (GPI). The methods a compositions are used for disgnosis and treatment of human autoimmune disease, e.g., human rheumatoid arthritis. This is the amino acid sequence of human anti-GPI-antibody heavy chain variable region

```
Novel neuromodulatory agent (a human IgM monoclonal antibody), promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system, useful to treat post-infectious encephalomyelitis.
                                                               Neuromodulatory; central nervous system; CNS; sHIGM22; LYM 22; AKJR4; ebvHigM MsI19D10; ebv HIGM CB2bG8; CB2iE12; CB2iE7; MSI19E5; virucide; antiparkinsonian; neuroprotective; nootropic; vulnerary.

The invention provides a neuromodulatory agent (I) capable of promoting central nervous system (CNS). (I) is capable of inducing remyelination, central nervous system (CNS). (I) is capable of inducing remyelination, central nervous system (CNS). (I) is capable of inducing remyelination, compared antibody to (I) can be signaling with oligodendrocytes. An humanised antibody to (I) can be selected from antibody shights? (LMM 22). ebviligh MeIDBIO, ebv High CS achected from antibody shights? (LMM 22). ebviligh MeIDBIO, ebv High CS axons, or treating demyelinating proliferation of glial cells in cremyelination of CNS axons, stimulating proliferation of glial cells in constant therapy. (I) is capable of binding to structures and cells within constitution of constant and the strain BA of Theiler's murine encephalomyelitis (TMEV) or for treating a human being having multiple sclerosis, or a constant disease of CNS. (I) is also useful for an in vitro method of stimulating the proliferation of glial cells from mixed cell culture. (I) can useful for stimulating remyelination of CNS axons. The antibodies are useful for preventing infection by a bacterium, virus or like conting in the cause demyelinating remyelination of CNS axons. The antibodies conting the selecosis, Parkinson's disease, Alzheimer's condition of disease, amyotrophic lateral sclerosis (ALS), a viral demyelinating demyelinating changes are disease, amyotrophic lateral sclerosis (ALS), a viral demyelinating demyelinating energed and energed as by trauma. The present sequence represents the shighZ2 heavy

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction.

Claim 2; Fig 2; 84pp; English.

This sequence represents a complementarity determining region 3 (CDR3) of the heavy chain variable domain of a human anti-factor IX/Ixa Gla domain antibody. Factor IXA/Ixa dramin K dependent plasma serine procease that participates in the blood coagulation pathways. The Gla domain of factor IXA and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial 

```
This sequence represents a complementarity determining region 3 (CDR3) of the heavy chain variable domain of a human anti-factor IX/IXa Gla domain antibody. Factor IXa is a vitamin K dependent plasma serine protease that participates in the blood coagulation pathways. The Gla domain of factor IXa and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial cells and platelets. Compositions comprising the antibodies are used for the treatment or prophylaxis of thrombotic or coagulopathic diseases or disorders in a mammal for which inhibiting a FIX/IXa mediated event is
the treatment or prophylaxis of thrombotic or coagulopathic diseases or disorders in a mammal for which inhibiting a FIX/IXa mediated event is indicated, e.g. deep venous thrombosis, arterial thrombosis, unstable angina, post myocardial infarction, post surgical thrombosis, coronary artery bypass graft (CABG), percutaneous transluminal coronary articy bypass graft (CABG), percutaneous transluminal coronary inflammation, septic shock, tumour growth, invasion or metastasis, inflammation, septic shock, hypotension, adult respiratory distress syndrome (ARDS), arterial fibrillation and disseminated intravascular coagulopathy (DIC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Complementarity determining region 3; CDR3; antibody; Gla domain; factor IX/IXa; blood coagulation; deep venous thrombosis; arterial thrombosis; unstable angina; post myocardial infarction; coronary artery bypass graft; CABG; stroke; tumour growth; metastasis; percutaneous transluminal coronary angioplasty; PTCA; inflammation; septic shock; hypotension; adult respiratory distress syndrome; ARDS; arterial fibrillation; disseminated intravascular coagulopathy; DIC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Anti-factor IX/IXa antibody H chain V domain CDR3 amino acid sequence
                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to a recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgent plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.
                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene for producing transgenic plant seed.
indicated, e.g. deep venous thrombosis, arterial thrombosis, unstable angina, post myocardial infarction, post surgical thrombosis, coronary artery bypass graft (CABG), percutaneous transluminal coronary angioplasty (PTCA), stroke, tumour growth, invasion or metastasis, inflammation, septic shock, hypotension, adult respiratory distress syndrome (ARDS), arterial fibrillation and disseminated intravascular coagulopathy (DIC)
                                                                                                                                                                                     GapB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, call proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                   Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tisaue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant cuch as maize or soybean. The method of producing a plant with the cerombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

CC The recombinant DNA construct is useful for improving plants with the cip properties or polynucleotide is useful for improving plant properties.

CC The recombinant DNA construct is useful for improving plants with increased resistance to plant disease, better growth rate by modification to content, improved yield by modified seed oil or protein yield and/or content, improved yield by modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, introgen or providing improved lignin production of carbohydrate, introgen or providing improved lignin production of carbohydrate, introgen or providing improved lignin production of carbohydrate, introgen or providing improved lignin provdering a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic form was obtained.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         72.0%; Score 36; DB 8; Length 652; 63.6%; Pred. New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 14688; 122pp; English.

WPI; 2004-061375/06

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a cransformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant cauch as maize or soybean. The method of producing a transformed plant cauch an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polymucleotide or polypeptide is useful for improving plant properties. Cr. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or afcought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of carbohydrate, introgen or content, improved yield by modification of carbohydrate, introgen or phosphorus use and/or uptake, by modification of photosynthesis or by production, improved plant growth and development under at least one stress condition, improved lighin production or improved algant production or improved alganing inproved alganing production or improved alganing production or improved alganing production or improved second in the sequence data for this patent did not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic content from uspro

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a crop plant comprised property. The plant is a crop plant contrained property comprises transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the improved plant properties. Cr the recombinant DNA construct is useful for improving plants with improved plant properties, e.g. improved cold, heat or a drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth rayled and/or content, improved yield by modified seed oil or protein yield and/or content, improved yield by modification of photosynthesis or by property or property or property or property. New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties. Claim 1; SEQ ID NO 14406; 122pp; English

one stress providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 11635; 122pp; English.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant baving an improved property comprises transforming a plant with the recombinant DNA construct and attensforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with

improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress production, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.

Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related polypeptides.

Claim 6; SEQ ID NO 1265; 192pp; French.

of L The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments it are useful for selecting probes and primers for detecting genes in monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins

```
expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially blosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire.wipo.int/pub/published_pct_sequences

AAY36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these diseases

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 17091; 122pp; English.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant with the ecombinant DNA construct and growing the transformed plant with the crecombinant DNA construct and growing the transformed plant with the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plants with construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plants with construct is useful for improving plants with construct is useful for improving plants with construct is useful for producing plants with construct to plant disease, better growth rate by modification of content, improved plant disease, better growth rate by modification of the plant growth and development under at least one stress condition, improved light production or improved galactomannan condition, improved light production or improved galactomannan condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence cate for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.thml.
